

1 of 1

The invention of the Personal Denture Remover solves a problem (the inability of most, if not all, denture users to easily remove their own dentures) that was never before resolved. The invention provides a convenient, useful and easy advantage that was never before offered to denture users, and it solved a long-felt, long-existing, unresolved need. The invention is an article of a material, such as metal or plastic, shaped or bent into a loop for the insertion of a denture user's finger at one end and a hook shaped at the other end which is to be inserted over a user's denture(s) for an easy removal of the denture(s) from the user's mouth.
